

Each issue of *Geochemical Perspectives* presents a single article with an in-depth view on the past, present and future of a field of geochemistry, seen through the eyes of highly respected members of our community. The articles combine research and history of the field's development and the scientist's opinions about future directions. We welcome personal glimpses into the author's scientific life, how ideas were generated and pitfalls along the way. *Perspectives* articles are intended to appeal to the entire geochemical community, not only to experts. They are not reviews or monographs; they go beyond the current state of the art, providing opinions about future directions and impact in the field.

About the cover

New tunnel at El Teniente, Chile, in operation for over a century and now the largest underground Cu mine. This development will add 50 years of mine life and 17 Mt of Cu metal from ~2 km depth using panel caving, a new style of mass underground mining. This development illustrates a "light at the end of the tunnel" for supply of a large fraction of the world's minerals, as mining shifts underground and reduces its surface footprint.
